

ProtoDUNE-VD Wire-Cell Noise Filtering · OmnibusNoiseFilter (per CRP)

raw ADC → per-channel baseline → coherent common-mode subtraction → shield coupling (top U) → cleaned ADC

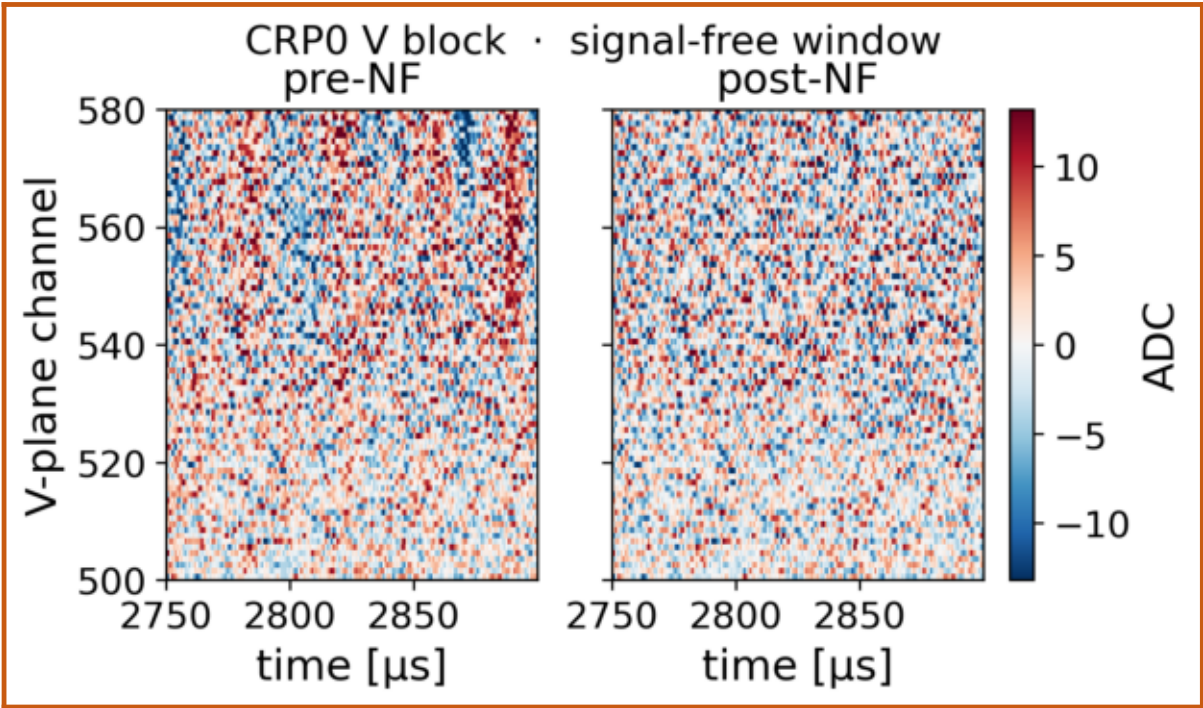

available in code — OFF here

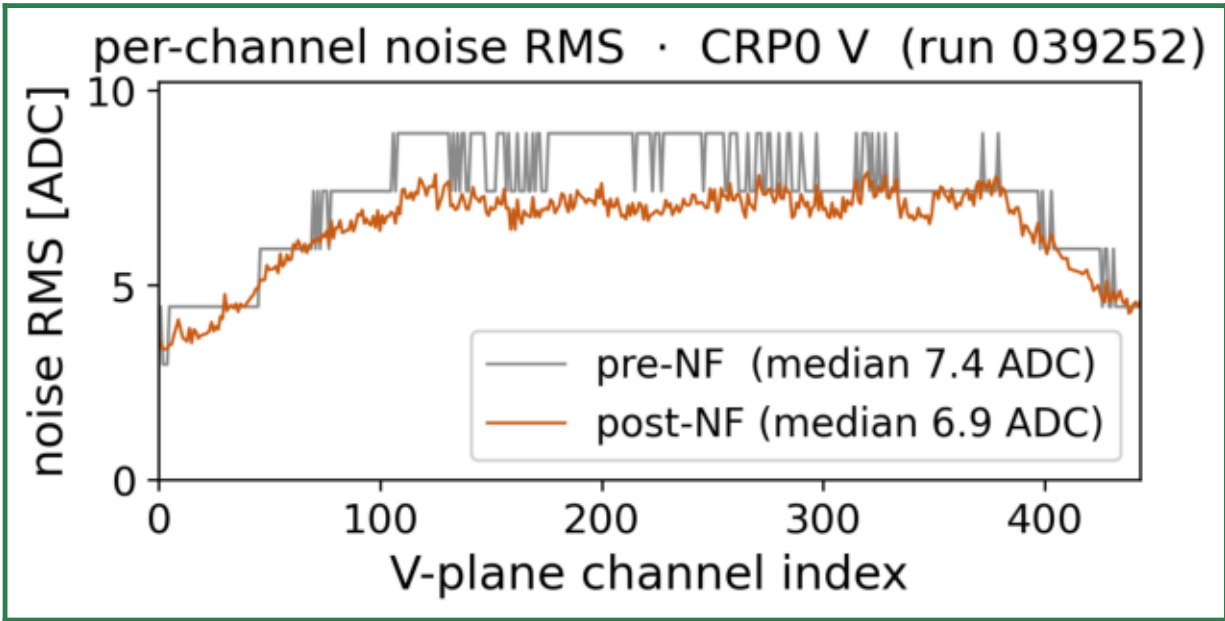

PDVD front-end is DC-coupled, so these MicroBooNE-era paths are left at their C++ defaults:

- adaptive baseline / IS_RC partial
- RC+RC undershoot deconvolution
- per-channel freq-notch masks

no PDHD-style FEMB neg-pulse stage

coherent-noise subtraction (data)

noise RMS: pre-NF → post-NF (data)
